1.0 INTRODUCTION

MWH, on behalf of the ACS RD/RA Executive Committee, started up the on-site groundwater treatment system at the American Chemical Service NPL Site (ACS Site) in Griffith, Indiana on March 13, 1997. The groundwater treatment plant (GWTP) system was designed to treat groundwater from the Perimeter Groundwater Containment System (PGCS) and the Barrier Wall Extraction System (BWES). The original treatment consisted of a phase-separator for oil and free product removal, equalization tanks, a UV oxidation unit for destruction of organic constituents, and an air stripper to remove methylene chloride and other organics. The treatment also included a chemical precipitation and clarification unit to remove metals, a sand filter to remove suspended solids, and activated carbon vessels for final polishing of the treated groundwater.

In 2001, an activated sludge treatment unit was added to the process to reduce the volatile and semivolatile organic compounds (VOCs and SVOCs) in the collected groundwater. The activated sludge treatment process also reduces the amount of activated carbon required to treat the water. An aerated equalization tank was also added to the GWTP in 2001 to remove VOCs from the collected groundwater, oxidize metals to increase metals removal efficiency in the chemical precipitation unit, and equalize groundwater flow through the GWTP. The activated sludge system and aeration tank have been fully integrated into the process along with the other upgrade components. Startup and optimization of the catalytic oxidizer/scrubber air treatment unit was also conducted during 2001.

MWH began eight initial rounds of off-gas sampling of the catalytic oxidizer/scrubber described in the PSVP during April 2002. Sampling rounds four through eight were conducted during the third quarter 2002. In addition, two more off-gas samples were collected in August and September 2002.

The treated effluent from the treatment system is discharged to the nearby wetlands, west of the treatment system, in accordance with Agency approvals. This Groundwater Treatment System report summarizes effluent analytical data, catalytic oxidizer/scrubber off-gas analytical data, and water level gauging data collected from July 2002 through September 2002. This report also details modifications or upgrades to the GWTP during the reporting period.

2.0 COMPLIANCE MONITORING

2.1 INTRODUCTION

Effluent samples are collected on a regular schedule from the treatment system to demonstrate compliance with the discharge limits (Table 2.1) established by Indiana Department of Environmental Management (IDEM) and United States Environmental Protection Agency (U.S. EPA). The approved Performance Standard Verification Plan (PSVP) requires quarterly effluent sampling for biological oxygen demand (BOD), total suspended solids (TSS), pH, SVOCs, metals, and polychlorinated biphenyls (PCBs) in the system, and monthly effluent sampling for VOCs, as shown in the table below.

During the past several years as the water treatment system has been modified and optimized, MWH has conducted sampling and analysis of all discharge regulated compounds on a monthly basis to maintain a closer documentation of system performance. The water treatment components are now functioning efficiently and showing stability in operation. Therefore, on June 5, 2002, MWH distributed a memorandum to the Agencies recommending that the sampling frequency be reduced to a monthly timeframe for volatile organic compounds (VOCs) and pH, and a quarterly timeframe for all other analytes, as specified in the PSVP. The Agencies agreed and in accordance with this plan, a full monthly effluent compliance sample was collected during July and analyzed for all of the analytes listed above. During August and September, the monthly effluent compliance samples were analyzed for VOCs and pH only.

Sampling and analyses were performed in accordance with the Quality Assurance Project Plan (QAPP) prepared by MWH for the ACS RD/RA Executive Committee in March 2001 and approved by the Agencies in November 2001. Quality control measures were also instituted in accordance with the PSVP and QAPP. The following table and paragraphs present details on sampling and analyses, and also summarize the analytical data for the treatment system effluent.

Sampling Frequency Schedule – Groundwater Treatment System

Analytes	Cumulative Time From Startup*	Frequency
Flowrate and pH	–	Continuous
BOD, TSS, SVOCs and Metals	181 days onward	Once per quarter
VOCs	31 days onward	Once per month
PCBs	181 days onward	Once per quarter
PCBs in Sediment (one location)	–	Once per year

*Note: System was started up on March 13, 1997

2.2 EFFLUENT SAMPLING AND ANALYSES

Effluent samples were collected each month during the third quarter 2002. Samples were collected on the following dates and analyzed for the listed analytes for this reporting period:

August 8, 2002	full analysis (pH, TSS, BOD, Metals, VOCs, SVOCs, pentachlorophenol, and PCBs)
August 29, 2002	pH and VOCs
September 26, 2002	pH and VOCs

The August 8, 2002 sample was originally collected on July 30, 2002, however it arrived at the laboratory above the holding temperature prescribed in the QAPP due to a shipping delay. Therefore, it was resampled on August 8, 2002.

The above samples were collected directly from a sample tap on the effluent line of the treatment system. The samples were placed in contaminant-free containers, in accordance with the U.S. EPA Specifications and Guidance for Obtaining Contaminant-Free Sample Containers (U.S. EPA, 1992). Appropriate sample containers and preservatives, as specified in the QAPP, were used to collect and preserve the samples. Following sample collection, the sample containers were refrigerated at or below 4° C in coolers. Chain-of-Custody forms were prepared to track the transfer of samples from the treatment system to the laboratories. In accordance with the approved QAPP, the effluent water samples were analyzed for the following parameters by the following analytical methods:

<u>Parameter</u>	<u>Analytical Method</u>
VOCs	SW-846 8260B
SVOCs	SW-846 8270C
Pentachlorophenol	SW-846 8270C and SIM
Pesticides/PCBs	EPA 608/SW-846 8081/8082
Metals (Excluding Mercury)	SW-846 6010
General Water Quality	EPA 160.2 and 405.1
Parameters (TSS and BOD-5)	
Mercury	SW-846 7470
pH	EPA 150.1

2.3 EFFLUENT ANALYTICAL RESULTS

The GWTP effluent monitoring data, summarized in Table 2.2, verify that the system effluent was compliant with the discharge limits presented in Table 2.1 throughout the quarter. No exceedences were reported. The analytical data sheets for the compliance samples are provided in Appendix A.

Compuchem Laboratory of Cary, North Carolina performed the analysis of the samples. Laboratory Data Consultants (LDC) of Carlsbad, California performed third party data validation in accordance with the U.S. EPA National Functional Guidelines for Organic/Inorganic Data Review. Validation qualifiers are listed in Table 2.2 and are written in the margin of the analytical data sheets provided in Appendix A.

2.4 CATALYTIC OXIDIZER/SCRUBBER OFF-GAS SAMPLING AND RESULTS

Off-Gas Sampling

Influent and effluent off-gas samples were collected from the catalytic oxidizer/scrubber unit (ME-106) in the GWTP six times during the third quarter 2002. These samples consisted of the final four of eight initial rounds planned for the catalytic oxidizer/scrubber unit and two additional rounds, Rounds 9 and 10. Samples collected during Rounds 1 through 8 were collected to comply with the PSVP and QAPP. Rounds 9 and 10 were performed to collect data for additional verification. Samples were collected on the following dates:

- July 2, 2002 (Round 5)
- July 12, 2002 (Round 6)
- July 18, 2002 (Round 7)
- July 25, 2002 (Round 8)
- August 8, 2002 (Round 9)
- September 30, 2002 (Round 10) – VOCs only

In accordance with the procedures of the PSVP, eight initial rounds of off-gas compliance sampling were collected from the catalytic oxidizer from April to July 2002. The catalytic oxidizer unit was sampled again in August and September 2002 (Rounds 9 and 10) while MWH evaluated the future catalytic oxidizer sampling frequency needs based on data from the initial eight rounds.

The sample collected on September 30, 2002 could only analyzed for VOCs due to a laboratory handling error that left the sample above the hold temperature prescribed in the QAPP for the other compounds.

The samples were collected directly from a sample tap on the influent and effluent lines of the catalytic oxidizer/scrubber. One influent sample (labeled IN1) and one effluent sample (EF1) were collected. A duplicate influent sample (IN2) was also collected. The samples were collected to comply with the PSVP and QAPP and in accordance with the QAPP and laboratory guidelines. The VOC sample was collected using a summa canister and the SVOC sample was collected in sorbent tubes.

Following sample collection, the SVOC sample containers were refrigerated at or below 4°C in coolers. Chain-of-Custody forms were prepared to track the transfer of samples from the treatment system to the laboratories for extraction and analysis. In accordance with the approved QAPP, the off-gas samples were analyzed for the following parameters by the following analytical methods:

<u>Parameter</u>	<u>Analytical Method</u>
VOCs	TO-14
SVOCs	TO-13

Sampling Results

The influent and effluent off-gas data summarized in Tables 2.3 and 2.4, verify that the off-gas from the catalytic oxidizer was less than the IDEM discharge limit of three pounds per hour VOC discharge throughout the quarter. For example, the VOC discharge reported from the July 2, 2002 sample was 0.009 pounds per hour, approximately 0.3 percent of the discharge limit. The analytical data sheets for the compliance samples are provided in Appendix B.

As the data from rounds one through eight indicate, the catalytic oxidizer is operating within its permitted requirement of discharging less than three pounds of VOCs per day. The data from rounds 9 and 10 provide further verification. Therefore, the catalytic oxidizer will be sampled annually, in accordance with the PSVP and the applicable IDEM regulations. The next sample is tentatively scheduled to be collected during June 2003.

Air Toxics Laboratories of Folsom, California analyzed the samples. The analytical results are summarized in Tables 2.3 and 2.4. MWH performed data validation in accordance with the QAPP and the National Functional Guidelines for Organic/Inorganic Data Review. Validation qualifiers are listed in Tables 2.3 and 2.4 and are written in the margin of the analytical data sheets provided in Appendix B.

3.0 TREATMENT SYSTEM PROCESS MODIFICATIONS

During the third quarter of 2002, minor modifications were made in the GWTP treatment system process. During July 2002, temporary piping was installed to distribute treated effluent from the GWTP to the On-Site Area and Off-Site Area for use in dust control during cover installation.

During August 2002, piping was installed in preparation for a heat exchanger pump system to be installed in Tank T-2. The heat exchanger pump system receives heated water from the in-situ soil vapor extraction system thermal oxidizer/scrubber. The heat exchanger was manufactured by Omega Thermo Products. A copy of the as-built fabrication drawing of the heat exchanger is included in Appendix C. To facilitate installation of the heat exchanger, tank T-2 was emptied, cleaned, and a 48-inch diameter manway was installed in its sidewall. Installation was performed by MWH and Ryan Construction personnel following the Site Health and Safety Plan (MWH, June 1999), including confined space entry procedures. Also, the activated sludge plant and aeration tank were insulated during August 2002. The insulation consists of three inches of R20 urethane foam that was installed by Momper Insulation. The insulation and heat exchanger system are designed to improve the treatment efficiency of the activated sludge plant and aeration tank during the winter months.

4.0 PGCS AND BWES GAUGING ACTIVITIES

The Perimeter Groundwater Containment System (PGCS) trench groundwater extraction wells were operated in "auto" mode continuously throughout the third quarter 2002. In "auto" mode, the PGCS extraction wells will pump continuously unless there is a high water level in Aeration Equalization Tank (T-102) or a low water level in individual extraction wells. This mode is used to control the flowrate through the treatment system. The GWTP also received influent from the Barrier Wall Extraction System (BWES) during the third quarter 2002.

In accordance with the PSVP for the Site, a discussion on the effect of the PGCS and BWES on the water table near the Site is presented in each quarterly monitoring report. This section presents a discussion on the groundwater elevation findings during the months of July, August, and September 2002. Groundwater elevation measurements were collected throughout the Site on September 9, 2002 as part of the groundwater monitoring program. The groundwater elevations and resulting contours outside the barrier wall are shown in Table 4.1 and on Figure 4.1. The water table contours shown on Figure 4.1 indicate that the PGCS continues to create a trough in the water table, which acts to contain groundwater flowing around the northern edge of the barrier wall.

The barrier wall was constructed to contain a contaminated zone under the Site, and the BWES was installed to collect the impacted water within the barrier wall. Piezometers were installed in pairs, one piezometer of each pair on either side of the barrier wall, spaced around the site. This allows measurement and tracking of water levels in order to ensure that the barrier wall is serving its designed function.

Table 4.2 presents the groundwater elevations inside and outside the barrier wall on September 9, 2002. They are illustrated on Figure 4.2. The groundwater elevation measurements were generally 1.57 feet to 7.08 feet higher outside the barrier wall. Only at two barrier wall pairs, P107/P108 and P114/P115, were the elevations higher inside the wall.

At On-Site Area piezometers P107 and P108 the water level was 1.57 feet higher inside the wall. This is due in part to the current focused dewatering of the Off-Site Area to allow for operation of the ISVE systems in the Off-Site Containment Area and Kapica-Pazmey Area, and due to seasonally low elevations outside the barrier wall. Also, there is no extraction trench near this area.

At Off-Site Area piezometers P114 and P115 the water level was 0.87 feet higher inside the wall. As MWH has actively dewatered the Site, especially the Off-Site Area, water table elevations at P114 have been steadily decreasing. The water level data measured outside the barrier wall during September were seasonally low. This is likely a temporary situation, as the water level measurement during March 2002 was several feet higher outside the barrier wall.

The data demonstrate that the barrier wall is successfully performing the intended function of isolating and protecting the groundwater from the known source areas of the Site inside the barrier wall. Due largely to the seasonally low groundwater levels outside the barrier wall, a few points showed outward gradients. However, MWH believes this is only a temporary situation, especially considering the consistently decreasing levels inside the barrier wall. MWH will continue to collect regular water level measurements across the Site as described in the PSVP.

To keep track of the groundwater table inside the barrier wall, water levels were collected from the various piezometers and air sparge (AS) wells on a regular basis, as shown in Table 4.3. Water levels were measured at seven piezometers in the On-Site Area regularly throughout the quarter (P29, P31, P32, P36, P49, P106, and P108). Water levels were measured at seven piezometers in the Off-Site Area (P96, P110, P112, P113, P114, P116, P118, AS-7, AS-8, and AS-9). The water level data from these piezometers are depicted graphically on Figures 4.3 and 4.4. The target water levels in each area are shown on these figures for reference. As part of the optimization of the GWTP and BWES upgrades, MWH began active dewatering of the Off-Site Area through increased groundwater pumping rates on September 25, 2001. The water levels inside the barrier wall are being lowered for proper operation of the in-situ soil vapor extraction (ISVE) systems.

Notes

All depth measurements and elevations are in units of feet

Elevation is in feet above mean sea level

TOIC = top of inner casing

TOC = top of casing

TOSG = top of staff gauge

CNM = could not measure (reason given under "Notes" column)

n/a = not applicable

¹ = A positive value indicates that the water level is higher inside the barrier wall. A negative value indicates that the water level is lower inside the barrier wall.

HEAT EXCHANGER AS-BUILT DRAWING

BILL OF MATERIAL

ITEM	QTY	DWG #	DESCRIPTION
1	9	D02172	Plate, 18 ga 2 ply welded 316L s/s, 30" x 84 1/8"
2	2	D02180	Cap, 4-1/2" OD x 1/4" thick 316L s/s
3	2	D02180	Manifold, 4" sch 10s, TP316L s/s
4	2	D02179	Pipe, coped, 3" sch 40s, TP316L s/s
5	4	D02176	Channel, slotted, 7 ga 316L s/s
6	2	D02178	Lifting lug, 7 ga 316L s/s w/ 1" hole
7	18	D02181	Nozzle, formed clam. 1" OD x 0.083" wall, TP316L s/s
8	18	---	Stay, 1/4" diameter round bar, 316L s/s

Detail 'A'

Notching of plates
for nozzlesLifting lug and plate
attachment to support channels
2X scale

Notes:

- Locate inflation quill (3/8" OD tube) at the plate edge at center of nozzle cutout area.
- Pillow height = 0.110" @ estimated 450 psig. Inflate with nitrogen.
- Maximum pneumatic inflation pressure = 500 psig
- Notch panel & open pillow to 1/4" overall inside pillow.
- Install plate nozzles. Cap with 14 ga plates (shop supply) for leak testing. Cut to final length after leak testing.
- Remove discoloration (buff) from nozzle welds prior to leak testing.
- Leak test individual plates with nitrogen at 250 psig.
- Stamp s/n 15479 in this location.
- Leak test plate bank with nitrogen at 225 psig.
- Heat transfer area = 303 ft^2
- Internal volume of plate bank = 2.2 ft^3
- Finished assembly weight = 645 lb.
- Cap nozzles with plastic caps for shipping.
- All dimensions are in inches unless specified

Rev	Non-code		Proof Tests: Omega 26		Size	Scale	DWG NO.	REV
	Design pressure = 150 psi	MDMT = -20° F @ 150 psi	Design temperature: 250°F	NDE: None				
1	Plate length was listed as 96"(after inflation). Overall length of 3" nozzles was reduced by design change from 12" extension to 96" overall assembly length.		Welded per Omega Thermo Products standards
